

VERSION 2.0

RELEASE NOTES

18 October 2020

General Information

MaxYield is developed to enable farmers to capture all details of their crop growing cycle. This lets the farmer acknowledge the work and resources invested into the crop while it is being grown. After some time of the farmer making use of the software, they can be able to optimise the growing of their crops by applying strategies which have proven to work best in the past, as captured and observed in the software.

Data Sharing

Sharing of data captured into the software is imposed on the user; where the software will prompt the user to synchronise data with the Agricultural Knowledge Management (AKM) platform, for which more information is available at <http://akm.machuzu.com>.

Non-Commercial Details

MaxYield is available for use at *no cost (free)* to the farmer. This essentially means that the farmer can download and use all the available features of the software on their Android or iOS device without paying any fees to the developer (Maestro IT) or any other party.

Use of the software allows the user to perform basic monitoring of their crops and does not produce any specific reports or charts for analysis.

Commercial Details

Agricultural Knowledge Management (AKM) provides data analysis services to farmers, and all other agricultural stakeholders. Therefore, should the farmer require analysis of the data which they submit to AKM on a monthly basis, they are to contact AKM; submit the specifications of their request, and be provided with a quotation for the services requested.

Other Data

MaxYield was admitted into the Royal Science and Technology Park (RSTP) Business Incubation program in July 2020, and we are currently under limited administration of the RSTP Incubation program.
